

Knowledge Mobilisation and Resource Based View of the Firm

**Client/Funder:** SDO and NIHR – Department of Health R&D Programme

**Lead contractor:** King's College, London

**Principle Investigator:** Prof Ewan Ferlie

### **Description**

Following an earlier Scoping Review, the same academic team was commissioned to undertake a literature review with the title: “Knowledge mobilisation in healthcare organisations: synthesising evidence and theory using perspectives of organisational form, resource based view of the firm and critical theory” (SDO Project 09/1002/13). It was a rigorous piece of work that investigated organisational and strategic management theories and considered whether they were well suited to the UK publicly-funded National Health Service. We used the work of major international thinkers to map an analytical framework that would be relevant to the NHS, involving economic concepts of performance, competition and strategic goals. The Resource Based View of the Firm concentrates on internal organisational strengths and the impact that managers can make on performance. Critical theory emphasises the role of conflict and authority. It highlights the difference between healthcare institutions, which employ powerful autonomous clinical professionals, and conventional firms with managerial chains of command.

### **Services provided**

Project management, methodology design, research, theory-building, presentation to Chief Executives, report and peer-review article writing

### **Highlights**

Organisation-specific features appear to be more important than external industry or market-condition factors (with a potential 22% premium). Leadership, management and internal resource base (e.g. organisational slack) allow one organisation to outperform another, even in the same difficult environment. We collected an evidence base that underscores the primacy of quality over cost-efficiency.
